Energy achieved vs graph size

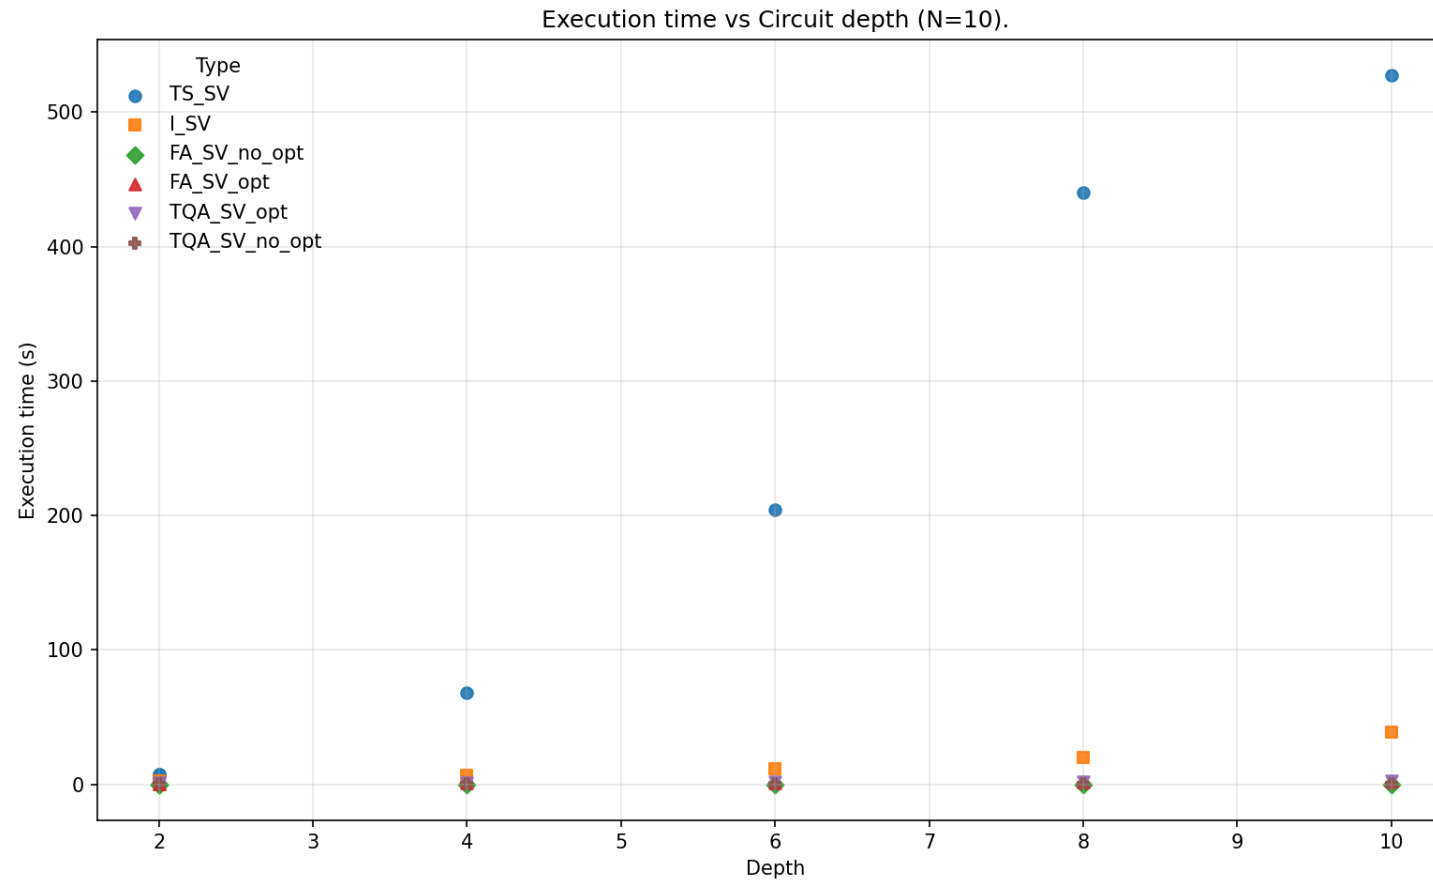

Results generated from random 3-regular graphs for different graph sizes (number of nodes) with exact energy evaluation.

Energy achieved vs depth

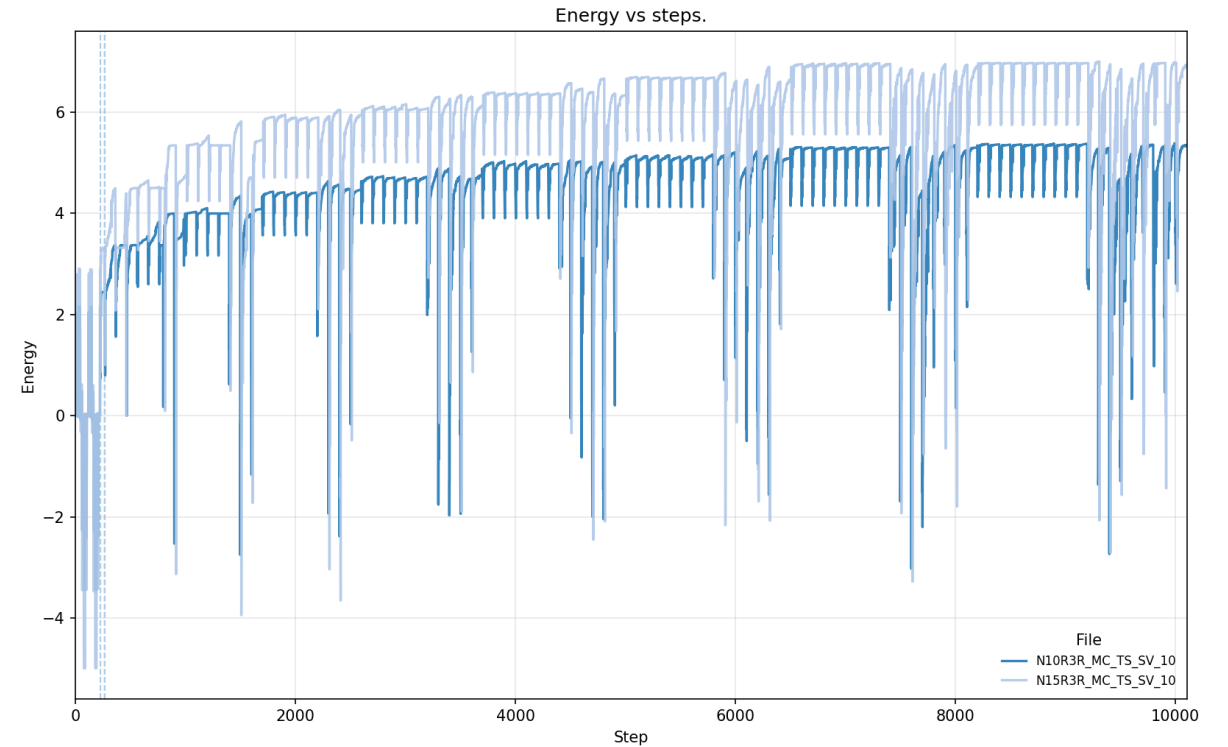

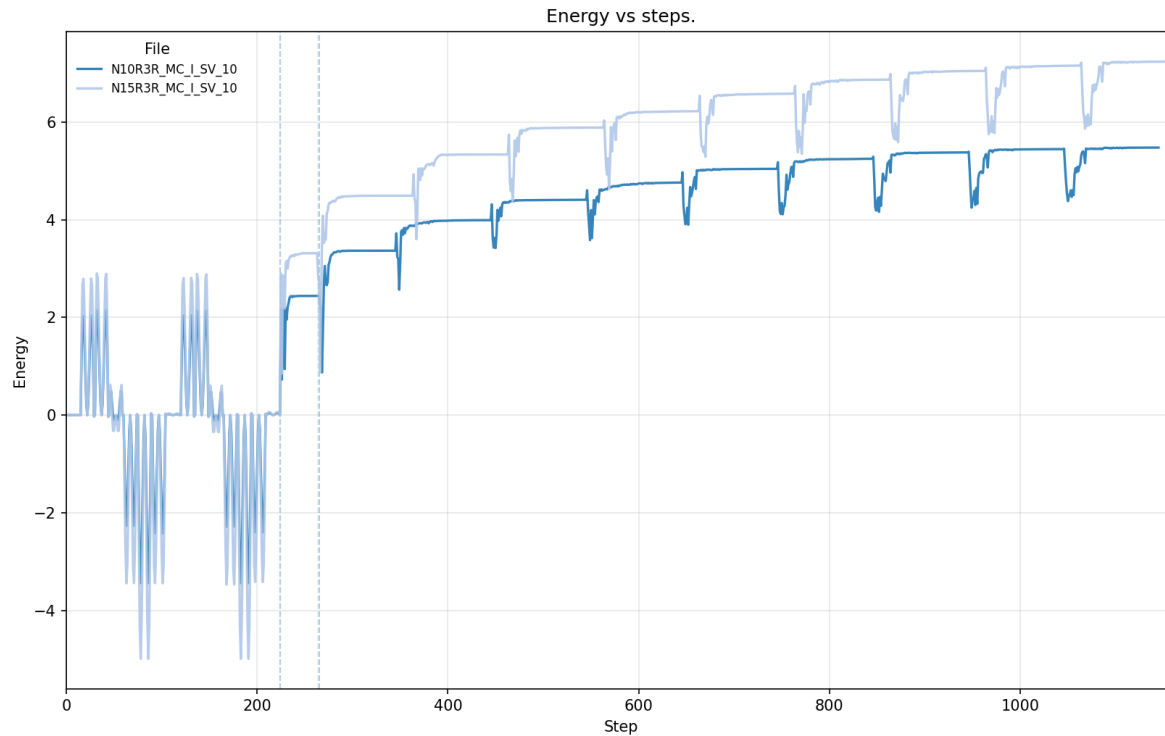

Results generated from a single instance of a random 3-regular graph with 10 nodes with exact energy evaluation

Execution time vs depth

Results generated from a single instance of a random 3-regular graph with 10 nodes with exact energy evaluation.

Energy history vs iterations

Results for the interpolation method (left) and transition states method (right), generated from a single instance of a random 3-regular graph with 10 nodes and depth 10, with exact energy evaluation.
